

Welser Profile Austria GmbH (WPA) & Welser Profile Deutschland GmbH (WPD)

In 2024, our production sites in Austria and Germany generated a total of 2,075 tonnes of CO₂e in the emission categories Scope 1 and 2.

This marks a 14% reduction compared to the previous year (2023: 2,423 tonnes of CO₂e). Compared to the base year 2019, when a comprehensive emissions screening was conducted for the first time, this corresponds to a reduction of 87% (2019: 16,842 tonnes of CO₂e).

This progress highlights the consistent efforts toward achieving CO₂ neutrality in our own production and business activities in Europe by 2026. The reduction in emissions was primarily achieved through the transition to 100% renewable electricity and the increased use of renewable energy sources, particularly photovoltaics and biomass.

Our direct emissions (Scope 1) include emissions from heat generation using fossil fuels, company vehicles, and the use of refrigerants.

Without the implementation of our reduction measures, our 2024 Scope 2 emissions from purchased energy - calculated using the location-based approach and country-specific emission factors – would have amounted to 8,039 tonnes of CO₂e. For comparison, in 2023 these were 8,301 tonnes, and in the base year 2019, 14,173 tonnes of CO₂e.

To further improve data collection and transparency, a software solution for gathering non-financial indicators was introduced in 2025. This is now being gradually rolled out across the group and will also cover Scope 3 emissions in the future.

EMISSIONS BY SCOPE (WPA + WPD)

Scope 1
2,029.93 tCO₂e (97.81 %)

Scope 2
45.54 tCO₂e (2.19 %)
